

CLAIM AMENDMENTS

This listing of claims reflects all claim amendments and replaces all prior versions, and listings, of claims in the application (material to be inserted in amended claims is in underline, and material to be deleted is in ~~strikeout~~).

1. (currently amended) A firearms cartridge, comprising:

a casing;

a primer;

a propellant; and

at least one projectile having a density of at least 10 g/cc, wherein the projectile is formed by compressing a powder-form composition of matter that includes a tungsten-containing powder and a binder that includes a metallic binder component and a non-metallic binder component, wherein the metallic binder component includes at least 50 wt% tin, and further wherein the non-metallic binder component includes at least one of a thermoset resin or epoxy and comprises 0.25 to 3 wt% of the powder-form composition of matter.

2. (original) The cartridge of claim 1, wherein the at least one projectile has a density of at least 10.5 g/cc.

3. (original) The cartridge of claim 2, wherein the at least one projectile has a density of at least 12 g/cc.

4. (original) The cartridge of claim 1, wherein the projectile further includes a coating.

5. (original) The cartridge of claim 4, wherein the projectile further includes a jacket.

6. (original) The cartridge of claim 1, wherein the cartridge is a shot shell.

7. (original) The cartridge of claim 6, wherein the cartridge includes a plurality of projectiles in the form of shot.

8. (original) The cartridge of claim 1, wherein the cartridge is adapted to be fired from a firearm having a barrel with rifling, and further wherein the at least one projectile is a single projectile in the form of a bullet.

9. (original) The cartridge of claim 8, wherein the bullet is jacketed.

10. (original) The cartridge of claim 8, wherein the bullet is frangible.

11. (original) The cartridge of claim 8, wherein the bullet is infrangible.

12. (original) The cartridge of claim 8, wherein the bullet is ferromagnetic.

13. (original) The cartridge of claim 8, wherein the bullet is not ferromagnetic.

14. (original) The cartridge of claim 1, wherein the tungsten-containing powder has a density of at least 15 g/cc.

15. (cancelled without prejudice)

16. (original) The cartridge of claim 1, wherein the tungsten-containing powder includes ferrotungsten powder.

17. (original) The cartridge of claim 1, wherein the tungsten-containing powder includes a tungsten alloy powder.

Claims 18-19. (cancelled without prejudice)

20. (previously presented) The cartridge of claim 1, wherein the metallic binder component includes at least 70 wt% tin.

21. (original) The cartridge of claim 1, wherein the metallic binder component constitutes less than 30 wt% of the at least one projectile.

22. (original) The cartridge of claim 21, wherein the metallic binder component constitutes less than approximately 25 wt% of the at least one projectile.

Claims 23-26. (cancelled without prejudice)

27. (currently amended) The cartridge of claim 23~~1~~, wherein the ~~polymer~~non-metallic binder component includes an epoxy.

28. (currently amended) The cartridge of claim 27, wherein the ~~polymer~~non-metallic binder component includes a flexible epoxy.

29. (currently amended) The cartridge of claim 27, wherein the ~~polymer~~non-metallic binder component includes a rigid epoxy.

30. (currently amended) The cartridge of claim 27, wherein the ~~polymer~~non-metallic binder component includes a flexible epoxy and a rigid epoxy.

31. (currently amended) The cartridge of claim 27, wherein the ~~polymer~~non-metallic binder component includes a first ~~polymer~~ one of a thermoset resin or epoxy, with the first one having a first composition and at least a second ~~polymer~~one of a thermoset resin or epoxy, with the second one having a composition different than the first composition.

Claims 32-33. (cancelled without prejudice)

34. (previously presented) The cartridge of claim 1, wherein the non-metallic binder component comprises less than 1 wt% of the projectile.

35. (original) The cartridge of claim 1, wherein the projectile further includes a lubricant.

36. (original) The cartridge of claim 1, wherein the composition of matter is not sintered.

37. (original) The cartridge of claim 1, wherein the composition of matter is sintered.

38. (currently amended) A method for manufacturing a medium-density article, the method comprising:

mixing a tungsten-containing powder with a binder powder to form a powder-form composition of matter, wherein the binder powder includes a metallic binder component and a non-metallic binder component, and further wherein the metallic binder component forms at least 10 wt% of the powder-form composition of matter and the non-metallic binder component forms ~~no more than~~ 0.25 to 3 wt% of the powder-form composition of matter and includes at least one of a thermoset resin or epoxy;

placing the powder-form composition of matter into a die; and

compressing the powder-form composition of matter to produce an article having a density of at least 8 g/cc.

39. The method of claim 38, further comprising the step of actuating the non-metallic binder component.

40. (cancelled without prejudice)

41. (currently amended) The method of claim ~~40~~39, wherein the ~~polymer~~non-metallic component is a heat-actuated ~~polymeric~~ component.

42. (currently amended) The method of claim ~~40~~39, wherein the ~~polymer~~non-metallic component is a water-actuated ~~polymeric~~ component.

43. (currently amended) The method of claim ~~40~~39, wherein the ~~polymer~~non-metallic component is a pressure-actuated ~~polymeric~~ component.

44. (original) The method of claim 38, wherein the metallic binder component includes a tin-containing powder.

45. (original) The method of claim 38, wherein the tungsten-containing powder has a bulk density less than the density of pure tungsten.

46. (original) The method of claim 38, wherein the compressing step includes compressing the composition of matter to at least 60 ksi.

47. (original) The method of claim 46, wherein the compressing step includes compressing the composition of matter to at least 75 ksi.

48. (original) The method of claim 38, wherein the method further includes placing the composition of matter into a jacket.

49. (original) The method of claim 48, wherein the method includes placing the composition of matter into a jacket prior to the compressing step.

50. (original) The method of claim 38, wherein the method includes coating the composition of matter after the compressing step.

51. (original) The method of claim 38, wherein the article is a firearms projectile.

52. (original) The method of claim 38, wherein the article is a golf club weight.

53. (original) The method of claim 38, wherein the article is a radiation shield.

54. (original) The method of claim 38, wherein the composition of matter is ferromagnetic.

55. (original) The method of claim 38, further including heating the composition of matter without sintering the composition of matter.

56. (currently amended) The method of claim 55, wherein the metallic binder component comprises at least 70 wt% tin and wherein the method further ~~includes~~ heating the composition of matter to a temperature that is less than the melting point of the metallic binder component.

57. (original) The method of claim 38, wherein the article has a density of at least 10.5 g/cc.

58. (original) The method of claim 57, wherein the article has a density of at least 12 g/cc.

Claims 59-62. (cancelled without prejudice)

63. (previously presented) The method of claim 38, wherein the powder-form composition of matter further includes a lubricant.

64. (previously presented) The method of claim 38, wherein the metallic binder component consists essentially of tin.

65. (previously presented) The method of claim 64, wherein the method includes heating the powder-form composition of matter to a temperature greater than 150° F and less than the melting point of tin.

66. (previously presented) The method of claim 38, wherein the non-metallic binder component includes a flexible heat-curable epoxy.

67. (previously presented) The method of claim 38, wherein the non-metallic binder component forms 0.25 to 1 wt% of the powder-form composition of matter.

68. (previously presented) An unsintered, frangible firearms projectile, comprising:

at least 60 wt% of a tungsten-containing component that consists essentially of at least one of tungsten, a tungsten-containing compound, a tungsten-containing alloy, and mixtures thereof;

less than approximately 30 wt% of a binder, wherein the binder comprises at least 70 wt% tin, wherein the binder further comprises a flexible heat-curable epoxy that forms at least 0.25 wt% of the projectile; and

wherein the projectile has a density of at least 10 g/cc.

69. (previously presented) The projectile of claim 68, further comprising a jacket that at least substantially encloses the projectile.

70. (previously presented) The projectile of claim 69, further comprising a casing, a primer, and a propellant to form a firearms cartridge containing the projectile.

71. (previously presented) The projectile of claim 68, wherein the projectile further includes a lubricant mixed with the tungsten-containing component and the binder.

72. (new) The cartridge of claim 31, wherein the at least one projectile includes at least one shot.

73. (new) The cartridge of claim 31, wherein the at least one projectile includes a bullet.

74. (new) The projectile of claim 70, wherein the projectile is a shot pellet and the cartridge is a shot cartridge.

75. (new) The projectile of claim 70, wherein the projectile is a bullet.

76. (new) The projectile of claim 75, wherein the bullet is a jacketed bullet.
